

Better World for All....

Ensure Access to Affordable, Reliable, Sustainable and Modern Energy for All

TEACHING

- 122 Course in several disciplines

RESEARCH

- 322 publications

Many research groups in FUE are working on energy-efficient systems; which includes the design of solar panels, development and improvement of the photovoltaic systems. FUE is involved in a number of research collaborations that are leading the way to alternative energy sources such as wind energy and photovoltaic systems. One such example comes from Photovoltaics Group, who are developing single and tandem solar cells with higher efficiencies. The main target is to contribute in The University's commitment towards reducing carbon emissions impact by taking actions as set out in the zero-carbon plan.

The effective implementation of **energy efficiency** in FUE buildings, involves the deployment of the established energy efficiency policy and plans. The formulation of an energy efficiency policy has been developed in partnership with relevant stakeholders. The policy was developed by the University technical unit which implement, facilitate, and enforce the efficient use of energy in the University buildings as well as establishing penalties for failure to comply to the energy efficiency building standards.

Followed Procedures

- Assess the Energy Requirements
- Support related research and projects
- Update related Educational Curricula
- Promote use of energy-efficient processes
- Create awareness and disseminate information

Cycle, Walk, Use Public Transportation, Or Carpool

Turn Off Lights When Leaving

Unplug Electronics When Not in Use

Go Paperless, Whenever Possible

Close The Doors When AC Is On

Reduce overcooling/overheating

FUE

*Better
World for
All....*
