Abstract

A series of highly functionalized hitherto unreported quinazolinones with different substituent at position 3 have been concisely synthesized in good yields via the reaction of 3-amino-6-bromo-2-undecylquinazoline-4(H)one with one carbon donor such as phenylisothiocyanate, /"halogenated compounds and chloroacetylchloride. Moreover, the reaction of 6-bromo-2-undecylbenzoxazin-4(H)onewith different hydrazides and 2-aminothiophenol was also investigated.The structures of all new synthesized compounds in this investigation were determined using spectroscopic tools (IR, 'HNMR, MS and 13C-NMR).
